

Families 2017

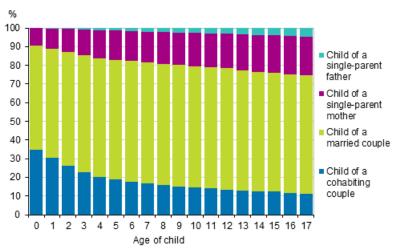

Annual Review

Share of children living with one parent increases with the child's age

Corrected 21 January 2020: Table 8 of Review 5 has been corrected. The corrections are indicated in red.

According to Statistics Finland's family statistics 2017, eighty-nine per cent of children aged under three live in families with two parents. In ten years, the share has gone down by two percentage points, while the share of children living in one-parent families in turn has grown by two percentage points. Of all babies aged under one, 91 per cent live with two parents and nine per cent with their mother only.

Children by type of family and age 2017

The share of children living with one parent increases with age. In 2017, one-fifth of children aged 17 lived with the mother only, a good decade ago the share was 19 per cent. Respectively, five per cent lived with the father only, which is one percentage point more than ten years earlier.

Every tenth child lives permanently in a reconstituted family, i.e. a family where at least one child aged under 18 is the child of one of the spouses only. Of these children in reconstituted families, 59 per cent are the mother's children, every tenth is the father's child and close on one-third are the spouses common

| children. Seven per cent of all children are actual children of reconstituted families, that is, children who have obtained a new social parent. The spouses are of the opposite sex in reconstituted families. |

1. Married couple without children is still the commonest family type

Families are classified according to whether the spouses are married, cohabiting or in a registered partnership and whether they have children. In addition to this, there are one-parent families as a separate category. In this classification, no limit is set as to the age of a child. Families with underage children, defined as families having at least one child under the age of 18 living at home, are discussed in Section 3. Where families with underage children are concerned, parents are also referred to as supporters. In the following examination, one-parent families are not only single-supporter families, as a person having the status of a child living with his/her mother or father may be of any age.

At the end of 2017, there were 1,472,000 families in Finland. The number of families fell the first time during the family statistics. Their number fell by 4,100 from the year before.

Altogether 74 per cent of the Finnish population belongs to a family. The proportion has decreased by 0.4 percentage points from the previous year. The rate of its decrease has remained at this level since the beginning of the 1990s. The proportion of the family population was at its highest in the 1960s and 1970s, when 87 per cent of the population belonged to a family. The number of persons belonging to a family fell by 17,000 during 2017. The country's total population increased by 10,000 persons. At the end of 2017, the average size of a family was 2.8 persons.

Table 1. Family population and average size of family in 1950 to 2017

| Year | Families total | Family population | Popu- lation | Proportion of family population, % | Average size of family |

| 2016 | 1 475 583 | 4 072 565 | 5 503 297 | 74,0 | 2,8 |
| 2017 | 1 471 500 | 4 055 224 | 5 513 130 | 73,6 | 2,8 |

The commonest family type in Finland is still a married couple without children, making up 36 per cent of all families in 2017. As recently as in 2004, the most common family type in Finland was a married couple with children of some age living at home. Twenty-eight per cent of all families were families of a married couple with children in 2017. The number of such families has been on the decline for a long time, whereas the number of married couples without children has been rising.

The number of cohabiting couples turned to a decline, while it has been growing slowly in recent years. As in the previous year, the relative share of families of cohabiting couples in all families was 23 per cent. However, cohabiting couples without children still make up only 15 per cent of all families. Today, eight per cent of all families are cohabiting couples with children.

"Mother and children" families represent ten per cent of all families. "Father and children" families are still rare; they number only two in one hundred. Their relative proportion has not changed much over the past few years.

At the beginning of March 2017, an amendment to the Marriage Act entered into force, as a result of which part of registered partners have changed their partnership into marriage and new registered partners can no longer be formed. At the end of 2017, there were 640 male couples and 834 female couples in a registered partnership, which is in total 1,210 couples fewer than in 2016. The number of male married couples was 524 and that of female married couples 1,042. Thus, there were almost 1,600 (0.1%) families of same-sex married couples. Of them, 67 per cent were families of female couples. There were 395 families of same-sex married couples with children.

Table 2. Families by type in 1950 to 2017

| Year | Total | Married couple without children ¹⁾ | Married couple with children ²⁾ | Co- habiting couple with children | Co- habiting couple without children | Mother and children | Father and children | Regis- tered male couple ³⁾ | Regis- tered female couple ³⁾ |

¹⁾ Of families of the type "married couple without children", 519 were families of male couples and 652 families of female couples in 2017.

²⁾ Families of the type "same-sex married couple with children" numbered 395 in 2017.

³⁾ Families of the type "registered couple with children" numbered 363 in 2017.

⁴⁾ The breakdown of the census by type of family has been revised on the basis of interview surveys. (Aromaa, Cantell & Jaakkola: Avoliitto (Consensual Union), Research Institute of Legal Policy 49, Helsinki 1981).

⁵⁾ The breakdown of the census by type of family has been revised on the basis of the 1981 register-based material on families and cohabiting couples.

1.1 Children of women aged 53 have moved away from home

Women's family types differ at different life stages. The most typical family type for women aged under 29 with family is "cohabiting couple without children". Already for women aged 29, the commonest family type is "married couple with children". This is natural as nowadays the first child is born at the average age of 29.2 and the first marriage is contracted at the average age of 31.7. "Married couple without children" only becomes the most typical family type for women once they have turned 53. The families of the oldest women (at least 92 years of age) tend to include a child rather than a husband. Just nine per cent of women of this age belong to the family population. In the light of family statistics, old age is different for men than for women. Thirty-five per cent of the men aged at least 92 belong to families. Then the family is typically a married couple without any children living with them.

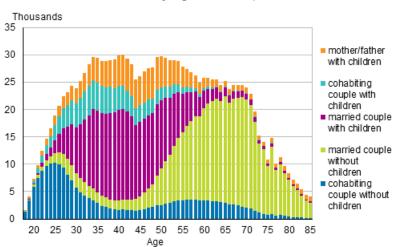

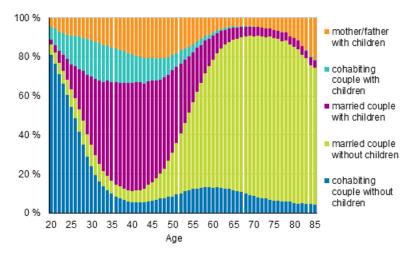

Figure 1. Families by type and age of wife/mother in 2016 (families with father and children by age of father)

1.2 First marriages for 80 per cent of married couples

Up to the age of 39, women without children tend to prefer cohabitation to marriage. Where mothers are concerned, the only ones to favour cohabitation over marriage are in the small group of mothers aged under 26. The majority of mothers older than this living with their spouses are married. The older the woman, the more likely she is to be married to her spouse.

Married couples account for 64 per cent of all families and for 74 per cent of all married and cohabiting couples. Cohabiting couples make up 23 per cent of all families and 26 per cent of all married and cohabiting couples.

In 80 per cent of all married couples both spouses are married for the first time. In 68 per cent of the cohabiting couples neither spouse has been previously married. Hence, on average, there are clearly more couples where one of the spouses has been married before among cohabiting couples than among married couples.

1.3 Majority of cohabiting persons are unmarried

Seventy-four per cent of the women and 75 per cent of the men living with a cohabiting partner without children are unmarried, so there is hardly any difference between genders here. More cohabiting women than cohabiting men are widows. There is not much difference in the marital status of women and men living with children and cohabiting partners.

Mothers and fathers in one-parent families differ in their marital status. More than one-half of the fathers and 43 per cent of the mothers are divorced. One-third of the mothers are unmarried and around one-fifth of the fathers. However, it should be noted here that no limit is set on the age of a child, i.e. we are not referring to single supporters only. The child of a one-parent family can be of any age, meaning that families formed by old widowed mothers and their grown-up children, for example, are included.

Table 3 also contains columns for one-parent families, that is, fathers and mothers whose children are underage. Their marital status structure differs most clearly from the group of all one-parent families: there are fewer widows and more persons representing all other marital status groups. It is worth noting that relatively more fathers than mothers of one-parent families with children are widowed, although fewer fathers than mothers become widowed. In divorces, children usually stay with their mother, but there is no choice in the case of death. Of mothers of one-parent families with children, 42 per cent are unmarried, some from the start having become mothers without a spouse, but a large number as the result of dissolved cohabitation.

Table 3. Marital status of the man/woman/father/mother in a cohabiting partnership and in a one-parent family in 2017, %

| Marital | Type of family | | | | | | | | |
|-----------|--|--|--|--|---------------------------|---|---------------------------|---|--|
| status | Co- habiting man no children | Co- habiting woman no children | Co- habiting man with children | Co- habiting woman with children | Father and children | Father and children aged 17 or under | Mother and children | Mother and children aged 17 or under | |
| Unmarried | 74,4 | 73,9 | 78,5 | 79,3 | 21,2 | 28,1 | 33,9 | 41,7 | |
| Married | 0,7 | 0,6 | 0,6 | 0,6 | 13,5 | 15,5 | 10,7 | 12,8 | |

| Widowed | 1,8 | 3,7 | 0,5 | 0,9 | 14,3 | 4,3 | 12,7 | 2,4 | |
| Total | 100,0 | 100,0 | 100,0 | 100,0 | 100,0 | 100,0 | 100,0 | 100,0 | |
| Number | 217 644 | 217 644 | 123 234 | 123 234 | 32 616 | 17 641 | 152 460 | 106 939 | |

2. Five per cent of families entirely foreign-language speaking

In 85 per cent of all families, the only parent or both parents are Finnish-speaking. Correspondingly, four per cent of families are entirely Swedish-speaking. Families where one spouse is Swedish-speaking and the other Finnish-speaking account for three per cent of all families. Combinations of Finnish and Swedish-speakers with other languages can be found in around four per cent of all families. Families where both of the spouses or the only parent are foreign-language speakers number 67,201, which equals five per cent of all families.

In clearly more cases Swedish-speaking men have Finnish-speaking spouses than Swedish-speaking women Finnish-speaking spouses. The number of purely Swedish-speaking couples is only 3,588 higher than that of Finnish and Swedish-speaking couples.

Altogether, 31,687 Finnish or Swedish-speaking men are married to or cohabiting with a foreign-language speaking woman. The corresponding figure for women is 25,377. Unions with foreign-language speakers increased by 1,415 in 2017.

Table 4. Families speaking Finnish, Swedish or other language in 1990, 2000, 2010, 2016 to 2017

| Man/woman | Year | | | | |
|--|----------------|-----------------|-----------------|-----------------|-----------------|
| Finnish, Swedish or foreign- language speaking | 1990 | 2000 | 2010 | 2016 | 2017 |

2.1 Fifteen per cent of Russian-speaking families are one-parent families

The largest foreign-language group in Finland is made up of Russian speakers. At the end of 2017, there were 15,751 such Russian-speaking families in Finland where the native language of the only parent or both parents was Russian. The number of families where either one of the spouses is Russian-speaking is slightly lower at 13,524. The number of Russian-speaking families is 533 higher than in the year before.

The number of Russian-speaking one-parent families is 4,440, which is 15 per cent of all Russian-speaking families. Among Russian-speakers, one-parent families are clearly more common than one-parent families are of all families (12.6%). Of Russian-speaking one-parent families, 94 per cent are formed by mothers and children, while this is so for 82 per cent of all families with one parent.

The most common language combination among the Russian-speaking families is one where the husband and the wife speak Russian. During 2017, the number of such couples has grown by 147. In 1990, there were only 300 Russian-speaking couples in Finland, today their number has gone up to 11,311.

The second most common language combination in Russian-speaking families is a Finnish-speaking husband and a Russian-speaking wife (8,634). It is still rare for a Finnish-speaking woman to have a Russian-speaking spouse. At the end of 2017, their number was 1,751.

2.2 Families of two foreign citizens are most common families of foreigners

In only six per cent (90,838 families) of all families in Finland at least one of the spouses or the only parent is a foreign citizen. There were only 12,500 such families in Finland in 1990 and as many as 36,000 in 2000. In the past year, the number of such families has increased by 1,949. In absolute numbers, most grew the number of families where a Finnish woman had a foreign man.

In the early 1990s, the most common combination in families of foreign citizens was one where the wife was a Finnish citizen and the husband a foreign citizen. The number of foreign families in which the wife was a foreign national and the husband a Finnish national was largest at the beginning of the 2000s. In 2013, the most common combination in families of foreign citizens was still one where the husband is a Finnish citizen and the wife a foreign citizen. In 2014, families of two foreign spouses became the most common family type for foreign citizens. Now the number of families formed by two foreign spouses is 27,235 (Figure 3). No distinction is made between married and cohabiting couples here.

In families where at least one of the spouses or the only parent is a foreign citizen, the largest group of foreign citizens is families with Estonian citizens, 15,046. In turn, families of Russian citizens numbered 11,650.

Entirely foreign families, i.e. families where the only parent or both spouses are foreign citizens, total 37,849. There were 4,872 families where both spouses or the only parent are Russian citizens at the end of 2017. There were 9,164 entirely Estonian families of which 31 per cent were families consisting of mother and children only. The number of Estonian families declined by 109 from the year before. Families of two Chinese citizens or with one Chinese parent numbered 1,385. The number of these families grew by 67 families from the previous year. Thirteen per cent of the families of Chinese citizens are families of mother and children only.

2.3 Men have more often a spouse born abroad than women

An examination of countries of birth gives the best picture of foreign-born spouses of Finns. However, it should be borne in mind that some children of two Finnish citizens are also born abroad. For example, the child can be adopted or the parents were living permanently abroad when the child was born. Finnish-born men have 41,126 foreign-born spouses. The number has grown by 559 from the year before. Finnish-born women have 35,500 foreign-born spouses; the number having grown by 804. Today, Finnish men more often have spouses born abroad than Finnish women.

The foreign-born spouses of Finnish men and women come from a variety of countries. Men's spouses were born mainly in the neighbouring countries and East Asia. Those born in the area of the former Soviet Union cannot be separated into Russians or Estonians (or those born in other republics of the former Soviet Union), because even the Estonians' country of birth is mostly the Soviet Union and a large number of the spouses from Estonia had already moved to Finland before the collapse of the Soviet Union. Finnish men have 12,481 spouses who were born in the former Soviet Union, Russia or Estonia, and 8,455 spouses who were born in Sweden. The number of spouses born in Thailand is 4,927. The next most common countries of birth for the spouses are China, the Philippines, Germany, the United States and Vietnam.

Women's spouses born abroad come from a higher number of countries than men's spouses. The number of spouses born in Sweden is 8,778. Husbands born in the former Soviet Union, Russia and Estonia number 3,007, which is 160 fewer than in the year before. The next most frequent countries of birth of Finnish women' foreign spouses are Great Britain, Germany, Turkey and the USA.

Figure 4B. Foreign-born spouses of Finnish-born women by country of birth in 2017

3. Thirty-nine per cent of families are families with children

At the end of 2017, there were 566,242 families with underage children in Finland. A family with underage children has at least one child under the age of 18 living at home. Families with underage children make up 39 per cent of all families. The percentage has been falling at a steady rate for the past few years. In all, 39 per cent of the population live in families with underage children, older siblings included.

The number of families with underage children fell by 3,434 from the previous year. The drop is 1,640 larger than in the year before. The number of families with children under the age of seven has decreased by 5,028 families from the year before.

Table 5. Families with underage children by type in 1950 to 2017

| Year | Total | Married couple with children | Co- habiting couple with children | Mother and children | Father and children | Regis- tered couple with children | Persons in families with under- age children | Families with children aged 17 or under | Families with children of all families, % | Population belonging to families with children, % |

¹⁾ The breakdown of the census by type of family has been revised on the basis of interview surveys. (Aromaa, Cantell & Jaakkola: Avoliitto (Consensual Union), Research Institute of Legal Policy 49, Helsinki 1981).

3.1 Fifty-eight per cent of families with underage children are families of cohabiting couples

The most common family with children is still that consisting of a married couple and children. Fifty-eight per cent of the families with children were families of married couples. This is the form of family with children which has seen a steady decline, both in absolute and relative terms, but other family forms with children are still far from its numbers. The number of families with a cohabiting couple and

²⁾ The breakdown of the census by type of family has been revised on the basis of the 1981 register-based material on families and cohabiting couples.

³⁾ Families of the type "same-sex married couple with children" numbered 388.

children also diminished. In contrast, the numbers of other types of families with children grew over the year. At the end of 2017, there were almost 111,100 families of cohabiting couples with underage children in Finland, which equals to 20 per cent of all families with underage children. Compared with 2016, the number of families of cohabiting couples decreased by 242.

Nowadays 57 per cent of firstborn children are born outside the marriage. Forty-five per cent of all children born in 2017 were born outside the marriage.

The number of families formed by a mother and children has grown by 1,200 families compared with 2016. At the end of 2017, families formed by mothers and children numbered 106,939. Over one-fifth (22%) of all families with children are one-parent families (mother and children or father and children). Families with children whose regular composition is father and children are still quite rare. There are only 17,641 such families.

At the beginning of March 2017, an amendment to the Marriage Act entered into force, as a result of which part of registered partners changed their partnership into marriage and new registered partners can no longer be formed. The number of families formed by a registered couple and children aged under 18 has declined by around 300 from the previous year. Now there are only 345 families formed by a registered couple and children. At the end of 2017, there were 388 families of same-sex married couples with children.

Figure 5A. Families with underage children by type of family and age of mother/single carer father in 2017

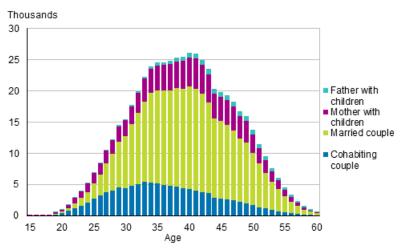

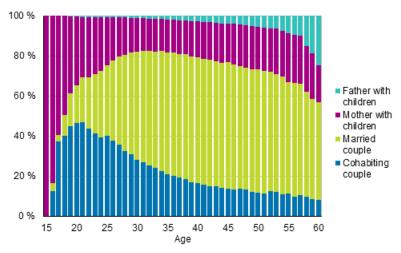

Figure 5B. Families with underage children by type of family and age of mother/single carer father in 2017, relative breakdown

3.2 Number of reconstituted families fell, but the share remained unchanged

A reconstituted family refers to a family that has a non-common child under the age of 18, i.e. the child has, in a sense, received a new social parent. The concept is more broadly interpreted in everyday talk: the weekend families born in consequence of diverse family splits are referred to as reconstituted families. However, statistics on families must be compiled according to the child's permanent place of residence. A child cannot be included in two families in the statistics. Divorced fathers and mothers with whom children only stay during weekends and holidays are not included in family statistics unless they have formed a new family. Families of same-sex couples are not taken into consideration in the examination of reconstituted families.

There are 51,300 reconstituted families representing nine per cent of all families with underage children. The number of reconstituted families grew slowly since 1990 when the first statistics concerning them were made. In the past ten years, their number has more or less stayed on the same level, but it seems to have turned to a decline in the last few years. From 2016, the number of reconstituted families diminished by 321.

Usually, the child of a reconstituted family is the mother's and has obtained a new social father. Altogether, 48 per cent of the parents of reconstituted families are married to one another and 52 per cent cohabit. If a common child is born to a reconstituted family, the parents usually marry, but otherwise they mostly cohabit. Families with "your children, my children and our children" living in the same household are still relatively rare, numbering 944.

Table 6. Reconstituted families in 1990 to 2017

| Year | Total | Married couple | Co- habiting couple | Re- consti- tuted families as a pro- portion of families with children, % | Mother's children | Father's children | Common children | Children aged 17 or under in re- cons- tituted families | Non- common children as a pro- portion of children of all families, % | Children in re- consti- tuted families as a pro- portion of children of all families, % |

| 2017 | 51 315 | 24 690 | 26 625 | 9,1 | 63 798 | 11 116 | 33 855 | 107 769 | 7,2 | 10,3 |

3.3 Number of families with two children has again decreased

When examining the number of children in families, allowance must be made for the family's stage of life. For example, families which have only had their firstborn are processed as one-child families in the statistics, as are also families with only their last-born living at home. Family statistics thus represent a cross-section of the situation at a given moment, i.e. the sizes of families in the country at a given point

in time, and not the eventual numbers of children in families. Hence, it is difficult to compare the statistics relating to different points in time because of the uneven age structure of the population.

The clearest long-term change in the number of children in families is the fall in the number and relative proportion of families with at least four children since the 1960s (Table 7). After the mid-1980s, the number of families with at least four children started to grow, although over the 2000s, the growth has been slow. The number of families with one child has been falling steadily. After two exceptional years, the number of families with two children has also continued falling. From 2016, the number of these families diminished by 685. In 2017, the number of families with three children remained at the same level and that of families with at least four children almost on level with the previous year. At the end of 2017, there were 438 families with at least ten underage children.

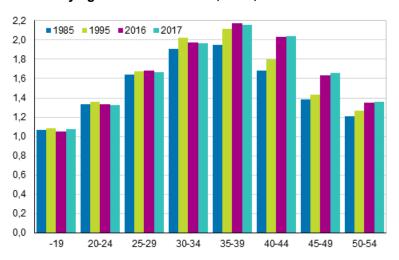

Table 7. Number of children in families with underage children in 1950 to 2017

The average number of children in a family with underage children is not directly comparable at different points in time, because the sizes of the age groups at various stages of family life vary. This does not give exactly unambiguous information either, since the childbearing age has continuously risen. In the 2000s, the average number of children in a family with children has remained nearly unchanged.

The recent trend can be seen in Figure 6, which shows the average number of underage children living at home according to the mother's age. The fact that women giving birth have become older is visible in that mothers aged over 40 have approximately the same number of children in each age group as in the previous year and clearly more than in 1995. In turn, mothers aged under 35 have the same number or slightly fewer children than in the mid-1990s.

Figure 6. Average number of children in families with underage children by age of mother in 1985, 1995, 2016 and 2017

4. Regional differences in prevalence of types of families with underage children

4.1 Number of cohabiting couples highest in Aland and Kainuu

The commonest type of family with children in all regions is one of a married couple although there are also clear differences in this. The proportion of married couples with children of all families with underage children varies by region between 65.5 per cent in Central Ostrobothnia and 47.5 per cent in Åland. The differences between regions arise from the prevalence of families of cohabiting couples and one-parent families. In relative numbers, most cohabiting couples are found in Åland, Kainuu and Lapland. In Åland, 32 per cent, in Kainuu, 27 per cent and in Lapland, 24 per cent of all families with underage children are families of cohabiting couples. The lowest share of cohabiting families in Finland is found in Uusimaa, 18 per cent.

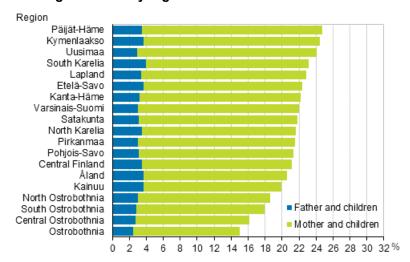

Region Åland Kainuu Lapland North Karelia Pohiois-Savo Etelä-Savo South Karelia Ostrobothnia Kvmenlaakso Central Finland Päijät-Häme Kanta-Häme Satakunta Varsinais-Suomi South Ostrobothnia North Ostrobothnia Pirkanmaa Central Ostrobothnia Uusimaa 10 12 14 16 18 20 22 24 26 28 30 32 %

Figure 7. Families of cohabiting couples as a proportions of families with underage children by region in 2017

4.2 Ostrobothnia and Päijät-Häme have the lowest proportions of one-parent families with underage children

There are fairly big regional differences in the prevalence of one-parent families with underage children. The number of one-parent families with underage children is lowest in Ostrobothnia, where 15 per cent of families with children have only one parent. In contrast, one-parent families with children account for 24.8 per cent in Päijät-Häme, which is the highest figure in Finland. After Päijät-Häme, the proportion of one-parent families with children is in relative terms highest in Kymenlaakso (24.5%) and Uusimaa (24.0%). After Ostrobothnia, the proportion of one-parent families with children is lowest in Central Ostrobothnia (16.2%) and South Ostrobothnia (18%). (Figure 8.)

Figure 8. Proportion of single-parent families of all families with underage children by region in 2017

The regional variation in the proportion of one-parent families with children is mostly due to the different proportions of families of the type mother and children. The proportion of families of the type father and children ranges from two to four per cent in all regions. The share is biggest in South Karelia (3.9%).

Examined by municipality in Mainland Finland, the proportions of one-parent families with children are highest in Harjavalta and Hartola (28.0%). The proportion of one-parent families with underage children is almost as equal in Helsinki, Multia and Turku (27.9%). The percentages are also high in several of Åland's municipalities, but most of the municipalities are so small that a change of the type of a few families may change much the percentages. The share of one-parent families is 27 per cent in Mariehamn.

In relative terms, Luoto (4.6%) and Pedersöre (7.1%) have the lowest number of one-parent families with underage children in Mainland Finland.

Luoto could be viewed as the most conventional municipality in terms of family structure, because it has the lowest proportion of one-parent families with children (4.6%) and the highest proportion of married couples (88.1%) in the whole country. The number of underage children living at home was highest in Lumijoki, Perho and Sievi, 3.0, on average. The average for the whole country is 1.85.

5. Sixty-three per cent of children live in a family of married couples

Families with children can also be examined by taking the child as the statistical unit instead of the family. Then the results are slightly different. For example, 58 per cent of the families with underage children are those of married couples, but 63 per cent of all children live in families of married couples, because these families have a higher average number of children than families of cohabiting couples or one-parent families. When the children of cohabiting couples and those of registered couples are included in the calculation, 81 per cent of underage children live in families with two parents.

5.1 Twenty-three per cent of children have no siblings

Although 43 per cent of families with children had only one child at the end of 2017, only 23 per cent of the children in these families had no siblings. The status of an only child is temporary for many of these children, as the majority of them will have a sibling later on. Some of these children may also have had an older sibling who has already turned 18 or moved away from home.

At the end of 2017, altogether 42 per cent of all children lived with one sibling and 35 per cent of all children had at least two siblings living at home. In 1985, only 27 per cent of all children had at least two siblings at home.

Table 9. Children by number of underage children in the family in 1985 to 2017

| 2017 | 100,0 | 23,1 | 42,1 | 21,6 | 13,2 | | |

The cross-sectional nature of family statistics is clearly illustrated in Figure 9, which shows the children of families by age and number of children in the family. Here all children living at home and aged under 18 are taken into account when determining the status of an only child. Of children aged under one year, 41 per cent are without siblings, i.e. they are firstborns in their families. The proportion of children without siblings, 13 per cent, is the lowest for children aged 7 to 8.

A second child has most likely been born to a family when the firstborn is aged around nine. On the other hand, the older sibling has only on rare occasions reached the age of 18. Since it can be assumed that some of the children aged 7 to 8 will still have a sibling and some of them already have one who has left home, it can be concluded that some ten per cent of children will remain permanently without siblings. The same results are attained when looking at the number of children according to the number of children born to women in the whole country.

Figure 9 indicates that a child's family is at its largest when he/she is nine years old. Around 43 per cent of children of that age live in families with at least three underage children.

Figure 9. Children by age and number of children aged 17 or under in the family in 2017

5.2 Number of siblings varies much between areas

There are also differences in the numbers of siblings by area. In areas where families are bigger, the proportion of children living with several siblings is naturally larger than in areas of small families. In North Ostrobothnia, 29 per cent of children have three or more siblings aged under 18 living at home. In contrast, nearly every tenth child in South Karelia, Uusimaa and Varsinais-Suomi is living with at least three siblings. In Åland, only seven per cent of children live with this many siblings.

North, Central and South Ostrobothnia also have the lowest proportions of children living without siblings – under 20 per cent. More than every fourth child in Åland, South Karelia and Uusimaa has no siblings living at home.

Region North Ostrobothnia Central Ostrobothnia South Ostrobothnia Ostrobothnia Central Finland Kainuu North Karelia Kanta-Häme Pohjois-Savo Whole country Pirkanmaa Satakunta Etelä-Savo Päijät-Häme Varsinais-Suomi Kvmenlaakso Uusimaa South Karelia Åland 0 10 20 40 50 70 80 90 100 % 60 ■No siblings ■1 ■2 ■3+

Figure 10. Children by number of siblings by region in 2017, %

5.3 Seven per cent of children have obtained a new social parent

In all, 107,769 children (10 per cent of all children) aged under 18 are raised in reconstituted families. The number of children raised in reconstituted families declined slightly from the previous year and the relative share remained nearly unchanged. Of them, 32,855 are the spouses' common children, that is, born to a family that previously had the mother's and/or the father's children only. Altogether, 44 per cent of reconstituted families have had common children born to the family as well. There are 74,914 actual children of reconstituted families (7% of all children), that is, children who have obtained a new social parent. Of these children, 63,798 were brought into the family by their mother and 11,116 by their father.

5.4 No change in the proportion of children with foreign background in the second generation

During 2012, Statistics Finland adopted a new origin classification. Persons whose at least one parent who was born in Finland are considered to be of Finnish background. Also, persons whose parents' data are unknown but whose native language is Finnish, Swedish or Sami are considered to be of Finnish background. Persons whose both parents or the only known parent were born abroad are considered to be of foreign background. Persons who were born abroad and whose both parents' data are unknown are also considered to be of foreign background. Using the origin classification, it is easy to distinguish between first (born abroad) and second (born in Finland) generation Finns with a foreign background. The following looks at all children belonging to the population of Finland.

Based on what is stated above, 86,000 or eight per cent of all underage children were of foreign background at the end of 2017. During the year, the number of underage children with foreign background has grown by over five thousand. In 1990, there were 3,500 underage children with foreign background in Finland.

Until 2003, there were more children with foreign background in the first generation than in the second generation, but in the following year there were slightly more children with foreign background in the second generation, 51 per cent. At the end of 2017, the share of children with foreign background in the second generation among all children with foreign background was 61 per cent. In recent years, the ratio has remained unchanged.

6. Share of young people with the status of a child unchanged

It is difficult to get a clear picture of changes in when children leave home, as students were previously not officially considered as permanent residents of their place of study. They were recorded in the population register as living with their parents. In June 1994, an act entered into force entitling everyone to choose their official municipality of residence. The legislative amendment had an effect on migration statistics until the end of the decade, although with less impact towards the end.

Children's leaving home is described below by the number of those with the status of a child in the family. A child of a family can, however, live at home and bring his or her spouse to live with him/her or have a child, whereby the young person forming a family no longer has the status of a child of the parents' family in the statistics but an adult in a family of his/her own. Such living arrangements are very rare in Finland. Between 1985 and 1993, even before the entry into force of the Act on the Municipality of Domicile, there was a steep fall in the percentage of young people with the status of a child. After the legislation entered into force, their share diminished even further until 2013, after which their percentage increased by two decimals. In 2017, the relative share of young people with the status of a child in the age group has not changed from the previous year.

Table 10. Young people aged 20 to 24 with the status of a child in 1985 to 2017

Young women leave home earlier than young men. Today, 67 per cent of women and 45 per cent of men have moved away from home by the time they are 20 years old. The proportion of women decreased by one percentage point from the year before and that of men remained unchanged.

Figure 11. Young men aged 18 to 30 by family status in 2017

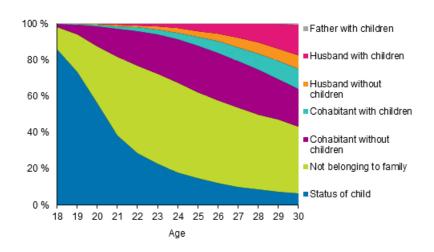

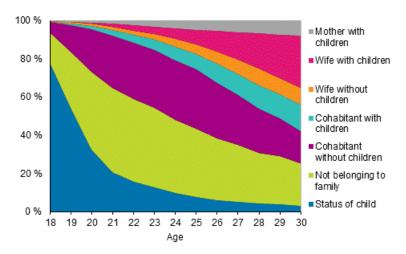

Figure 12. Young women aged 18 to 30 by family status in 2017

Finland has around 54,000 persons who have turned 30 and hold the status of a child in their family. Of them, 75 per cent are men. However, the number of such persons with the status of a child and aged at least 30 has decreased from the previous year.

7. Living alone varies by age

The proportion of those living alone of the total population has grown in the past two decades by one to three per cent per year. At the end of 2017, a total of 22 per cent of Finland's population were living alone. A household-dwelling unit of two persons is the most common mode of living, accounting for around one-third of the population. The share of four-person household-dwelling units is 17 per cent. (Figure 13)

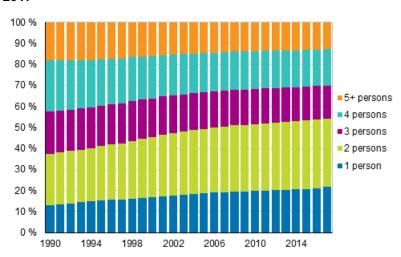

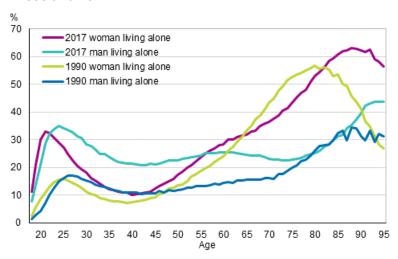

Figure 13. Household-dwelling unit population by size in 1990 to 2017

There are differences between genders in the prevalence and timing of living alone. In absolute numbers, the biggest groups of those living alone are women aged 70, in all 14,374 persons and men aged 25, i.e. 12,470 persons. In all, women live by themselves more often than men do. Of all women aged 18 or over, 27 per cent live alone and 25 per cent of men.

In the life cycle of women, living alone varies more than among men. More than every fourth woman aged 20 to 25 live alone, but after turning 25 the probability of living alone falls for women. For men, living alone during early adulthood usually continues longer than for women, because over one-quarter of those aged 21 to 32 live alone. Thus, the probability of men living alone starts to fall considerably later than for women, that is, only when they are over thirty years old. For women, living alone is most probable at old age: one-half of women aged 79 or over are living alone. For men, the probability of living alone is biggest at old age and on the other hand, as young adults. Women living alone does is rarest at the age of 40 to 41, when every tenth woman lives alone. In turn, living alone is rarest for men at the age of 18 to 19.

After 1990, men living alone has become more common in all age groups, particularly among men at working age and those aged over 90. For women living alone has become more general especially for those aged under 25 and over 85. Living alone is now rarer for women aged 65 to 80 than in 1990.

Figure 14. Men and women living alone as a proportion of age group in 1990 and 2017

Appendix tables

Quality description, families 2017

1. Relevance of statistical information

The basic data file derives from the population information system of the Central Population Register and covers the population permanently resident in Finland on 31 December 2017.

The Population Register Centre and local register offices maintain Finland's Population Information System. The last population registration was carried out in Finland on 1 January 1989. After that the Population Information System has been updated by notifications of changes. The data stored in the Population Information System are specified in the act on the Population Information System and on the certificate services of the Population Register Centre (21 August 2009/661). Notifications on population changes for the past year are expected by the last day of January. At the beginning of February the Population Register Centre supplies to Statistics Finland the population data for the turn of the year.

Statistics Finland's function is to compile statistics on conditions in society (Statistics Finland Act of 24 January 1992/48). These include also family statistics. Statistics Finland's Rules of Procedure define the Population Statistics unit as the producer of family statistics (Statistics Finland's Rules of Procedure, TK-00-954-18).

Concepts

In the family statistics **children** comprise the following persons living with their parents:

- biological children;
- · adopted children;
- biological children and adopted children of one of the spouses.

Foster children and children in the care of the family are not classified as children.

The definition of child has changed since 1990. A child is now defined as a person who lives with his or her parents irrespective of his or her marital status, unless the person has a spouse or children who live in the same household-dwelling unit. In 1990 only unmarried persons were counted as children. So while in 1990 widowed or divorced persons living with their parents were classified as not belonging to families, since 1992 they have been regarded as members of the family.

A **cohabiting couple** is defined as two spouseless adults of different sex aged 18 and over and occupying the same dwelling on a permanent basis, provided their age difference is less than 16 years and they are not siblings. In case the couple has a common child these specifications do not apply. Same-sex persons living together are not inferred as cohabiting couples. Only registered partnerships are recorded in the statistics.

A **dwelling** refers to a room or a suite of rooms which is intended for year-round habitation; is furnished with a kitchen, kitchenette or cooking area; and has a floor area of at least 7 square metres. Every dwelling must have its own entrance. A single-family house may be entered through an enclosed porch or veranda. If a dwelling is entered through the premises of another dwelling, it is not regarded as a separate dwelling but the two constitute one dwelling.

The **dwelling population** comprises those persons who, according to the Population information system of the Population Register Centre, resided permanently in dwellings at 31 December. Persons permanently institutionalised, living in residential homes and abroad and homeless people are not included in the dwelling population. Likewise, persons living in buildings classified as residential homes, whose living quarters do not meet the definition of dwelling, are not included.

The basic family population differs from the dwelling population in that it also includes those living in residential homes.

A **family** consists of a married or cohabiting couple or persons in a registered partnership and their children living together; or either of the parents and his or her children living together; or a married or cohabiting couple and persons in a registered partnership without children.

Starting from 1 March 2002, same-sex couples have been able to register their partnerships. By the amendment to the Marriage Act, same-sex persons have been able to enter into marriage starting from 1 March 2017. At the same time, registration of partnerships was abolished. Along with the amendment, persons in a registered partnership can change their partnership into a marriage by making a joint notification concerning it to the local register office.

Persons living in the household-dwelling unit who are not members of the nuclear family are not included in the family population, even if they are related, unless they form their own family. Brothers and sisters or cousins living together are not a family and do not belong to the family population. The same applies to people who live alone or with a person of the same sex, unless they form a married couple or a registered partnership.

Families living in residential homes are included in the family population. In contrast, persons who live in institutions are not included.

A family can consist of no more than two successive generations. If the household-dwelling unit comprises more than two generations, the family is formed starting from the youngest generation. This means, for example, that a mother-in-law or father-in-law living with their child's family will not be included in the family population unless they live together with their spouse, in which case the old couple form their own family.

A family with underage children refers to a family which has at least one child aged under 18 living at home.

Family members are grouped by family status as follows:

- spouse, no children;
- spouse with children;
- cohabiting partner, no children;
- cohabiting partner with children;
- partner in a registered partnership, no children;
- partner in a registered partnership with children;
- father/mother without spouse;
- · child.

In the family statistics children comprise all persons, regardless of age, who live with their parents, or the spouse's biological or adopted children, but not foster children or children in the care of the family.

A family with underage children is a family comprising at least one child aged under 18 living at home.

A household-dwelling unit consists of the permanent occupants of a dwelling. Persons who, according to the Population Information System of the Population Register Centre, are institutionalised, homeless, abroad, or registered as unknown, do not constitute household-dwelling units. Additionally, persons living in buildings classified as residential homes do not form household-dwelling units if their living quarters do not meet the definition of a dwelling.

When tabulating same-sex married couples or registered partnerships together with married or cohabiting couples, a **man** refers to the older partner of a same-sex married couple or a registered couple.

The number of children refers to the number of children who are living at home and have the status of a child.

The number of children in families with underage children refers to the number of children aged under 18 living at home.

In **a reconstituted family**, a child aged under 18 is a child of only one of the spouses. Not all the children aged under 18 in the family are common children.

A **spouse** refers to either a married or cohabiting partner or one of the partners of a registered partnership, unless otherwise indicated in the context.

Families are grouped into the following family types:

- married opposite-sex couple without children;
- married same-sex couple without children;
- cohabiting opposite-sex couple without children;
- married opposite-sex couple with children;
- married same-sex couple with children;
- cohabiting opposite-sex couple with children;
- registered male couple without children;
- registered male couple with children;
- registered female couple without children;
- registered female couple with children;
- mother with children;
- father with children.

A married or cohabiting couple without children refers to a couple who has never had any children or whose children no longer live with their parents. 'Cohabiting couple with children' contains couples who have common children and also couples whose children are not common.

For reasons of data protection, those living in registered partnerships are grouped together with married persons in municipal tables.

When tabulating same-sex married couples or registered partnerships together with married or cohabiting couples opposite sexes, **wife** refers to the younger partner of a same-sex married couple or a registered couple.

A man with a family is a married or cohabiting partner, a father with children and both partners of a registered male couple.

A woman with a family is a married or cohabiting partner, a mother with children and both partners of a registered female couple.

2. Methodological description of survey

The computer program classifies persons on the basis of their permanent place of residence code into household-dwelling units. The record of each person permanently residing in the dwelling includes the personal identification codes of his or her parents, spouse and children. By comparing them the program forms the families.

Before 1990, cohabiting couples were solely inferred with the help of common children. Since year 1992 inferences have been made using a revised program. After joining married couples in the household-dwelling units, this program identifies as cohabiting partners persons who live in the same dwelling, do not have a spouse, are aged 18 or over, and are of the opposite sex, provided that they are not siblings and their age difference is not more than 15 years. These rules do not apply to cohabiting couples with common children.

According to the former concepts, a sole-supporter mother with whom a man of suitable age is residing will be classified as a cohabiting couple. Likewise, the daughter of a family and a man of suitable age possibly residing with the family now form a cohabiting couple.

The inference of families is made difficult by the fact that the population information system is unable to distinguish between subtenants and the rest of the family. According to the reliability study of the 1990 census, there were less than 20,000 subtenants in Finland at that time and nothing indicated that the amount would be growing. Hence, any inferences where the subtenant is identified as the cohabiting partner of the landlord/lady cannot amount to any considerable number, as the precondition is that the subtenant is of a suitable age and a different sex from the spouseless landlord/lady.

If there is more than one suitable candidate, the program selects the person closest in age. If there are more than four persons without a spouse, the program does not classify them as cohabiting couples.

Families are not formed from institutionalised persons.

3. Correctness and accuracy of data

Family statisticians in Finland are privileged in that they have access to a population information system in which each person has, besides his or her personal identification code, also a domicile code, which tells the dwelling where he or she lives. Family statistics can be compiled from the entire population on an annual basis and quickly without burdening people with costly enquiries. Besides Finland, Denmark is the only other country where this is possible.

The inference of families from the population information system causes problems, mainly in two respects:

- 1. Only persons who are registered as domiciled in the same dwelling can be linked as a family.
- 2. Cohabiting couples (marriage-like relationship) will have to be inferred.
- 1. According to international concept definitions, the family can also be formed on the basis of the official place of residence, as is done in Finland. However, the families where one of the spouses is registered as domiciled in another locality, due to work, for example, will not be entered in the statistics as complete although he or she spends the weekends and vacations with the rest of the family. Likewise, a couple may reside together, although one of them is still registered as domiciled in some other place, with his or her previous spouse, for example.

In Finland the majority of people do, however, live in the place where they are registered as domiciled. In general, the Population Information System of the Population Register Centre can be considered very exhaustive as regards persons. In order that a person obtains a personal identity code, he or she has to be registered in the Population Information System. It is practically impossible to live in Finland without a personal identity code. A personal identity code is needed so that one can work legally, open a bank account, have dealings with authorities and so on. It can be safely assumed that Finland cannot have any substantial numbers of 'moonlighters' who receive their pay in cash for periods of over one year, for example. Staying in Finland for at least one year is the prerequisite for registering into the population of Finland.

After the abolishment of yearly checking of domicile registers in 1989 the Population Information System has been maintained only by notifications of changes to population information. Their correctness is determined by a reliability survey made on the addresses in the Population Information System.

The Population Register Centre charges Statistics Finland with the task of conducting a sample survey on correctness of address information. Around 11,000 people are asked whether their address in the Population Information System is correct. In the 2012 survey, the address was correct for 98.9 per cent of the respondents. The non-response of this survey was 16.9 per cent. As regards the non-response, attempts were made to check the addresses from other sources. The address could be ascertained as correct for 92.3 per cent and as incorrect for 5.9 per cent of the persons included in the non-response. The address of 1.8 per cent of the persons in the non-response could not be checked. If we assume that all the unchecked data of persons in the non-response are incorrect, the final proportion of correct addresses would be 98.1 per cent.

In connection with municipal elections, returned notifications of voting sent to foreigners usually reveal around 1,000 persons who have moved from the country without giving notice and are thus still included in the Finnish population. The Population Register Centre removes them from the resident population in the Population Information System before the following turn of the year.

A total of 8,262 persons who have probably moved abroad have been removed after analyses from the population data derived from the Population Information System for the end of 2017. These persons are foreign citizens whose address is unknown and who have not received wages and salaries, capital income, entrepreneurial income, unemployment benefit, pension income, income support or compensation from sickness insurance between 2015 and 2016.

Unlike before, students may register as domiciled in the locality where they are studying thanks to the Municipality of Residence Act. The Act came into effect in 1994.

2. Inferring a marriage-like relationship from the population information system is more problematic. One alternative is not to enter childless cohabiting couples in the statistics at all and to link cohabiting couples only with the help of common children. But since statistics are supposed to give as truthful a picture of society as possible, we will surely get closer to the truth by inferring cohabiting couples on the basis of a common address than by leaving them out of the statistics altogether.

The program is also bound to infer non-existing cohabiting couples. On the other hand, it does not classify as cohabiting couples persons aged under 18, nor does it classify those whose age difference is over 15 years as such. The number of cohabiting couples inferred with the help of the program is, however, very close to the figures obtained by interview surveys conducted before the inference was started.

In 1989 cohabiting couples were obtained by a separate interview survey. The interview focused on persons, not families. The question was only posed to persons whose marital status was 'not married'. On the basis of the sample, it was estimated that there were 372,000 cohabiting persons aged 15-64 in Finland. In the family statistics for the following year 370,000 persons were classified on the basis of their addresses as cohabiting persons aged 18-64. However, some of these persons had the marital status 'married'. According to the samples, the number of cohabiting persons grew at an annual rate of some 20,000 at the end of the 1980s.

By taking into consideration the differences in age limits and the importance of the marital status in the inference of cohabiting couples, it may be observed that, by inference, the number of cohabiting couples is slightly smaller than the real situation measured by samples. The inference of cohabiting couples does, however, convey a good enough picture of the family structure in Finnish society. Hence it helps us to monitor the trend in families and to examine different types of families as larger groups. Certain caution should, however, be exercised in making unit-level inferences on the basis of these couples.

4. Timeliness and promptness of published data

Statistics Finland dates the population at the turn of the year as at the last day of the year. Since 1999 the regional division used has been that of the first day of the following year. Thus the municipalities that unite on the first day of the new year are already combined in the statistics on the last day of the previous year. Where necessary, statistics at the turn of year can also be produced with the municipality division before the unification.

5. Accessibility and transparency/clarity of data

The first family statistics are available from the 1950 and 1960 population censuses. From 1970 onwards population censuses have been conducted every five years. In addition, family data have been published in the years 1977, 1978, 1982, 1984 and 1987. Since 1992 family statistics have been compiled yearly. The Families publication has been produced yearly from 1994.

From 1980 to 1989, a yearly review based on a sample of around 10,000 persons was conducted on those living in consensual union in connection with the Labour Force Survey.

From 1870 to 1930 a population census based on person questionnaires was made in major towns every ten years. Some information about household-dwelling units is available from these censuses.

Basic family data are available in electronic form by municipality or with larger regional divisions than municipality in Statistics Finland's free Stat Fin -online service on the Internet at: http://www.stat.fi/tup/tilastotietokannat/index en.html

General information and long time series on the families of the whole country can be obtained from the home page of Families at: http://www.stat.fi/til/perh/index en.html

The chargeable information service contains more specified information about the families by sub-area of municipality, for example. More information about the service can be found at: http://www.stat.fi/tup/tilastotietokannat/index_en.html

More information about Statistics Finland's chargeable services is available at: http://www.stat.fi/tup/tilastotietokannat/index_en.html

6. Comparability of statistics

Family data are not fully comparable before and after 1990, when cohabiting couples were first concluded on the basis of their living together. For the Families publication, family distributions, inclusive of cohabiting couples without common children, were estimated using the sample surveys for the whole country for the years 1960 and 1970. The figures for 1980 and 1985 were extracted from the original data with the new classification. Inclusion of cohabiting couples in the statistics increases the number of families and at the same time decreases the number of one-parent families, because some of these parents are cohabiting with their new spouses.

The fact that the marital status of the person classified with the status of a child has not been limited after 1990 also increases the number of families. For example a divorced person who comes back to live with his or her mother forms a family with the mother, while earlier the mother and the child were recorded as being outside the family population.

7. Coherence and consistency/uniformity

The figures of demographic family statistics differ somewhat from the family figures of population censuses. In these census statistics the concept is household-dwelling population, whereby the families whose dwellings do not fulfil the criteria for a dwelling are excluded from statistic on family.
